

# Car Performance Test Data Sources

## Public Performance Databases

- <sup>1</sup> **Zero to 60 Times (zeroto60times.com):** A user-maintained database of acceleration stats. The site bills itself as “the most accurate, comprehensive...listing of 0-60 MPH and quarter-mile statistics online,” covering hundreds of car models <sup>1</sup>. (Data span many makes/years; each entry lists 0–60 times and 1/4-mi times, typically aggregated from magazine tests.)
- <sup>2</sup> **0-60Specs.com:** An extensive car performance table listing 1,121 model-year variants with both 0–60 MPH and quarter-mile times. The site explicitly cites sources like *Car and Driver*, *Motor Trend*, *Road & Track*, *Edmunds*, and *MotorWeek* <sup>2</sup>. (Entries include the best published test runs, often including trap speed and sometimes skidpad G.)
- **FastestLaps.com (performance laps):** A large online archive (tens of thousands of entries) of sprint and lap times. For example, FastestLaps advertises ~57,900 quarter-mile/0–60 runs for ~23,800 cars (up to 2026) and also compiles lateral-acceleration (“grip”) figures <sup>3</sup>. (Data are viewable online by model or make.)

## Magazine & Track Archives

- <sup>3</sup> <sup>4</sup> **MotorTrend & Car and Driver Archives:** These leading magazines have multi-decade instrumented-test archives. *MotorTrend* notes having “73 years of test data” in its analysis of the quickest 0–60 cars <sup>3</sup>. *Car and Driver* publishes the full history of its “Lightning Lap” track tests: a table of every lap time at Virginia International Raceway (VIR) from 2006–2025 (345 cars, 300+ runs) <sup>4</sup>. (These sources imply underlying datasets of 0–60/1/4-mi runs and cornering/braking, though only summary lists are public.)
- <sup>5</sup> **Road & Track (Motown Mile):** *Road & Track* built its own test track (“Motown Mile”) to run comprehensive tests. Each result lists full-lap time, top speed, and maximum lateral-G. For example, R&T’s reported tests show the 2013 SRT Viper did the mile in **54.55 s**, hit **138.94 mph**, and peaked at **1.132 g** lateral <sup>5</sup>. (R&T posts these results monthly, building a growing database of car performance data.)
- **Other Magazines:** Publications like *Top Gear*, *Autocar*, *Evo*, etc. also report test-track data (e.g. Top Gear’s official lap times are tabulated online). *MotorTrend*’s archives include timed acceleration/braking (0–60, 1/4-mi) for new vehicles. (Note: many detailed archives require subscriptions or are summarized in features rather than raw tables.)

## Developer APIs & Spec Databases

- <sup>6</sup> <sup>7</sup> **Auto-Data.net and Edmunds API:** The free Auto-Data.net catalog offers detailed specs (including performance metrics) for **≈53,500** vehicle variants <sup>6</sup>. (Individual car pages list 0–60 and 1/4-mi times where available.) Edmunds.com historically provided a free car database API (years of makes/models with specs), though its current access has changed <sup>7</sup>. These services allow programmatic retrieval of published performance figures.

- **Kaggle and Open Datasets:** Data science repositories (Kaggle, UCI, etc.) contain user-compiled car-performance tables. For example, Kaggle hosts “Sports Car” datasets listing make/model, horsepower, 0–60, 1/4-mile, etc., often scraped from magazines. (These derive from the same sources above.)

## Research & Trend Compilations

- **8 Academic Analyses:** Researchers have scraped and compiled large-scale performance data. For instance, an MIT Mobility Initiative report plotted fleet-average 0–60 MPH times (1960–2024) by scraping the 0-60Specs site <sup>8</sup>. Such analyses indicate that “0-60 Specs” and similar databases can be mined for long-term performance trends.

**Sources:** Authoritative web archives and publications, as cited above. Each source contains extensive data drawn from decades of automotive testing and specifications. (Where possible, direct data pages or official summaries are cited.)
